pected to help him. If a man has married a woman in his father's matrisib, then his father and his children will be in the same sib. Since only a dead father can so help his son, we have here an expression of the unity and mutual support of a sib and its members in the previous life and the afterlife as well as in the present life. It is important, I believe, to add here that the Tiwi do not believe in reincarnation.

It is interesting to speculate, on the basis of the above, what happens if a man marries women of different sibs. If his mother has also married men of different sibs, Ego will have "fathers" in different sibs to help him find children for his various wives.

Thus, as far as sib exchange is concerned, the Tiwi marriage system is a symmetrical one. When we consider the entire social system of the Tiwi, we see a tendency toward atomism. There are 22 matrisibs, grouped today into five exogamous phratries. Sib membership in phratries is subject to change (Pilling 1957), and the phratries themselves have segmented twice since Hart's visit in 1929. We consequently cannot consider the phratries as stable units in the social organization, and indeed the Tiwi themselves do not. If all marriages were correctly arranged as exchanges between two sibs, we would have eleven independent and symmetrical marriage systems. When this possibility is considered in relation to the data on Tiwi local organization, the potentialities for further symmetry and atomism are quite evident.

Exchange Between Local Groups

There are ten major land divisions on Melville and Bathurst Islands, called by the Tiwi *tungarima* or "countries." Rights to the land of the *tungarima* are determined, for both males and females, by the location of the grave of one's father, and there is a marked preference for patrilocal residence. The *tungarima* are, in themselves, agamous. They are, however, subdivided into smaller districts, each inhabited either by a single large patrilocal extended family or by a group of closely related smaller households. Since incest regulations dictate that extended families are exogamous, we may consider that in many cases, if not all, the local group will also be exogamous.

Unilateral Type A marriage contracts will therefore involve a minimum of three such households or local groups. But the marriage system might still be symmetrical within the *tungarima* or country organization, and the total effect might be to localize the matrisibs in pairs. Each country could then be considered as comprising an independent marriage system. The *tungarima* do reveal marked political, economic, and ceremonial independence, but at least today the matrisibs are not localized. The mythology on the origin of the sibs (Mountford 1958), however, strongly indicates that they were at one time conceived as being localized, and this would account for the stated existence of local spirit-child centers with sib affiliations

Tjipripu River, stands the Snake Bay Native Settlement where about 180-200 natives live along with two or three white employees of the Department of Welfare of the Australian Government and their families.

It was not always like this. Formerly there were no white men and the tribe lived scattered throughout the entire countryside. The land was divided into "countries," each owned by a division of the tribe, and providing the owners with all necessary food, clothing, and shelter. Although many changes have come to the tribe in the last fifty years through contact with the early buffalo shooters, the missionaries, and the government, the individual Tiwi is, with few exceptions, a hunter at heart. He may have acquired new skills such as a knowledge of English, and the ability to work at cutting lumber in the sawmill or driving a truck, but in doing so he has not lost the skill to track down the wallabies or possums in the bush or fish in the sea, nor has he lost the desire to do so. There are, of course, exceptions—those who prefer working in the settlement or in Darwin and attempt to make their own way into the white man's world. A few are successful and never return; others, not so successful, try it for a while and return to alternate between doing their bit in the settlement and going on "vacation" into the bush when they feel the need of a change of pace.

By the end of October I too felt the need of a change of scene. I had been living at the settlement or close to it for seven months. I had watched the Tiwi as they built the settlement buildings, started formal schooling and helped run the everyday affairs of a community of two hundred souls. I had watched them in the evenings when they often performed portions of their lengthy ceremonies necessary to the proper burial of a fellow tribal member. I had accompanied them on weekends whenever they had camped in the surrounding countryside, and had gathered and consumed the tasty native food as a variation to corned beef, vegetables, flour, tea, and sugar of the settlement menu. But after seven months I too grew tired of corned beef, and as the daily increasing humidity announced the approach of the wet season I was anxious to go hunting once more before travel became difficult. Another sign of the approaching change of seasons, observed with great interest by the natives,
